

Device Test

1. ~~Hub~~ Behaviour of HUB

When the Hub receives the data, it broadcasts the data to every connected device in the network.

Which device matches the ~~mac address~~
which device matches the MAC address
that device can then open that data.

2. Behaviour of Switch

When the switch receives the data, the switch stores the source MAC address and receiving port number in the MAC address table. If the switch knows the destination MAC address, it unicasts the message to a destination device.

Otherwise, it broadcasts the data to every device in the network.

3. Behaviour of Router

When the router receives the data, the router checks the route for the destination IP in the route table.

If the route is available, it unicasts the message to the destination device.
